### **PROCEDURES FOR BED BUG TREATMENT / CONTROL**

1. At first sign or suspicion of bed bug activity, have the area inspected by a professional.
2. Do not disturb the room. Please ensure that there are no housekeeping duties performed, in order to maintain evidence of insect activity.
3. It is necessary to inspect all adjacent rooms (above, below, across). No pesticides are applied unless insect activity is confirmed.
4. After confirmation of insect activity, Wagar's Pest Control will take control of the room. It will be the responsibility of the technician to dismantle the room and do the initial bed bug treatment of the room, using industry-best practices, with a combination of mechanical (heap-vac) and pest control products.
5. Laundry and drapery must be taken care of by housekeeping, with an established procedure for the cleaning process.  
*Proper Cleaning Process:*
  - *Bagged in soluble bag, one bag per load*
  - *Heat options are always on the highest setting possible*
  - *Dry Clean Only material can be inserted into the dryer for 30 minutes.*
6. Installation of mattress encasements is strongly recommended.
7. Rooms must be quarantined for 6 hours.
8. The technician will determine when the room can be back in service.
9. Wagar's Pest Control will determine the necessary follow-up process, which may consist of:
  - *Follow-up treatment to be determined depending on severity of infestation*
  - *Follow-up inspections will occur between 2 days to 1 week*
  - *Pest control treatments will be completed again if evidence of insect activity is still present*
  - *Subsequent follow-up inspections will persist until all parties are confident that the problem has been resolved*
